

I am a farmer who has used precision Ag products for over 20 years. If LightSquared is allowed to use high powered signals right next to the current GPS, this will totally make unusable these precision tools. I will be forced drastically increase my inputs of seed, fertilizer, chemicals, labor and time which will lower my efficiency and productivity and will make a huge impact on my bottom line. This will severely hinder my ability to farm "green" and will raise prices of almost everything that the general public needs. These same signals will also severely hamper air traffic, the military, all emergency personnel and our national power grid. LightSquared should not be allowed to use bandwidth so close to these vital services now being provided to the general public.
